### Case Report

A 60-year-old asymptomatic woman presented for upper gastrointestinal endoscopy. A reddish protrudent polyp in the gastric antrum was shown (Figure 1A). Magnifying endoscopy with narrow-band imaging model identified the polyp characterized by dilated glands with branching architecture (Figure 1B). The patient received endoscopic polypectomy by endoscopic mucosal resection. Histopathological examination confirmed chronic inflammation of pyloric gastric mucosa with fibrous interstitial and focal glandular hyperplasia (Figure 1C). Beautiful and amazing polyps are often eye-catching [1]. The postoperative course was uneventful. Follow-up endoscopy after 1 year confirmed no recurrence.

**Figure 1:** **A.** A reddish protrudent polyp in the gastric antrum was shown. **B.** Magnifying endoscopy with narrow-band imaging model identified the polyp characterized by dilated glands with branching architecture. **C.** Histopathological examination confirmed chronic inflammation of pyloric gastric mucosa with fibrous interstitial and focal glandular hyperplasia.

### Author's contributions

Collection of data and writing: Xu-Yang Zhang.

Manuscript preparation: Xu-Yang Zhang.

Final approval of the manuscript: Wei Liu.

### Conflicts of Interest

The authors have no conflicts of interest to declare.

### Ethical Statement

The authors are accountable for all aspects of the work in ensuring that questions related to the accuracy or integrity of any part of the work are appropriately investigated and resolved. Written informed consent was obtained from the patient for publication of this "GI Image". Board institutional approval was not required.
